# Liquid fuel options for maritime

Fuel	Pros	Cons	Outlook
Liquified Natural Gas (LNG)	<ul style="list-style-type: none"> <li>• Energy density 18% higher than HFO</li> <li>• Infrastructure available and growing</li> <li>• Low Sulphur emissions</li> <li>• “Cleanest” fossil fuel</li> <li>• Mature technology</li> <li>• Regulatory route established</li> </ul>	<ul style="list-style-type: none"> <li>• Volumetric density only 43% of HFO</li> <li>• Slippage (unburnt fuel)</li> <li>• Natural gas prices unstable</li> <li>• Requires carbon capture to be considered low/zero carbon</li> </ul>	<i>Limited CO<sub>2</sub> reduction but maturity of technology higher than other alternative fuel options</i>
Biofuels	<ul style="list-style-type: none"> <li>• Mature technology</li> <li>• Drop in technology (HVO)</li> <li>• Could be blended</li> </ul>	<ul style="list-style-type: none"> <li>• Questions over feedstock origin and environmental impact</li> <li>• Scalability</li> <li>• Competition for feedstock</li> </ul>	<i>Little to no modification is needed to adopt HVO (100% FAME unlikely). Concerns over feedstock and scalability</i>
Hydrogen	<ul style="list-style-type: none"> <li>• Can be combusted directly or in fuel cells</li> <li>• Energy density 3 times higher than HFO</li> <li>• Carbon free combustion</li> </ul>	<ul style="list-style-type: none"> <li>• Volumetric density only 7% of HFO</li> <li>• Leakage</li> <li>• Current production mainly via fossil fuels</li> <li>• Storage requires cryogenics or very high pressure</li> </ul>	<i>Requires huge increase in production which must be “Green”. Hydrogen essential for other fuel pathways</i>
Ammonia	<ul style="list-style-type: none"> <li>• Can potentially use existing infrastructure</li> <li>• Haber-Bosch process well established</li> <li>• Scalable production</li> </ul>	<ul style="list-style-type: none"> <li>• Highly toxic and corrosive</li> <li>• Current production from fossil fuels</li> <li>• Production of green ammonia limited by hydrogen availability</li> </ul>	<i>Ammonia production and distribution is an established worldwide. Availability of hydrogen is key to further scale up</i>
Methanol	<ul style="list-style-type: none"> <li>• Can be stored as a liquid</li> <li>• Existing supply chain and storage in ports</li> <li>• Storage under standard conditions</li> <li>• Maersk ordered 13 methanol vessels to date</li> </ul>	<ul style="list-style-type: none"> <li>• Current production from fossil fuels</li> <li>• Lower energy density</li> <li>• Worldwide production would need significant ramping up</li> <li>• Regulation still under development</li> <li>• Requires carbon capture to be Net Zero</li> </ul>	<i>Industry giants backing methanol as a fuel however, it still requires carbon capture</i>

# Sustainable fuel for HGVs

- Can reduce carbon emissions by up to 90 percent
- It is a drop in fuel for a number of OEM vehicles
- Requires on site fuel storage
- XPO logistics recently announced that 53 vehicles will be powered by HVO
- Concern over competition for feedstock

# Production Case Study: Altolto – Velocys & British Airways

**Velocys, in collaboration with British Airways are developing a commercial plant in Immingham, U.K. to make sustainable jet fuel.**

It is expected to be Europe's first commercial scale waste-to-jet-fuel facility.

The plant will **process 500,000 tonnes of household and commercial waste** destined for landfill or incineration each year.

The plant is expected to **produce 60 million litres of sustainable jet and road fuel annually.**

The project has been a recipient of both F4C (£934,00) and GSGF funding (£2,381,000.)
